

About WFH APP

WFH APP is a free tool for Slack to check the work status of each member when they work from home. Setting flows are below.

1. Define and link Slack user and list channels that the user wants to post automatically with command, at Config.gs.
2. Register Slack apps and /wfh commands, then enable them.
3. Type /wfh commands in channels on Slack and script will post a predefined message to all your channels.
4. /wfh commands results are calculated in time and recorded in the WFH report sheet. The manager can easily check the operating status just by looking at it.

How it works

- Slack admin installs the WFH APP and then you can use /wfh command in the chat box in that channel.
- When a user types a /wfh command in Slack, the fixed text is posted to the channel that WFH APP has registered.
- At the same time, the data is automatically recorded on the Google Spreadsheet.

Notice:

task commands response to the exact channel where the user posts at.
